JavaScript

Challenges and Bugs

There are too many to list. At almost every step, I ran into issues, mainly related to syntax and similar methods. Most of the time, I researched using W3Schols, Stack Overflow, and MDN.

One issue occurred when I called functions in HTML that were inside jQuery's document ready. To fix this, I moved all the function calls into js, which made everything run correctly.

More than logic or anything else, just learning the nuances and quirks of javascript was the greatest challenge.

I also found that helping other students with their issues taught me more than what I would have gotten on my own.
